Programming Multi-Agent Systems

6th International Workshop, ProMAS 2008
Estoril, Portugal, May 13, 2008
Revised Invited and Selected Papers
These are the proceedings of the International Workshop on Programming Multi-Agent Systems (ProMAS 2008), the sixth of a series of workshops that is aimed at discussing and providing an overview of current state-of-the-art technology for programming multi-agent systems.

The aim of the ProMAS workshop series is to promote research on programming technologies and tools that can effectively contribute to the development and deployment of multi-agent systems. In particular, the workshop promotes the discussion and exchange of ideas concerning the techniques, concepts, requirements, and principles that are important for establishing multi-agent programming platforms that are useful in practice and have a theoretically sound basis. Topics addressed include but are not limited to the theory and applications of agent programming languages, the verification and analysis of agent systems, as well as the implementation of social structure in agent-based systems (e.g., roles within organizations, coordination and communication in multi-agent systems).

In its previous editions, ProMAS constituted an invaluable occasion bringing together leading researchers from both academia and industry to discuss issues on the design of programming languages and tools for multi-agent systems. We were very pleased to be able to again present a range of high-quality papers at ProMAS 2008. After five successful editions of the ProMAS workshop series, which took place during AAMAS 2003 (Melbourne, Australia), AAMAS 2004 (New York, USA), AAMAS 2005 (Utrecht, The Netherlands), AAMAS 2006 (Hakodate, Japan), and AAMAS 2007 (Honolulu, Hawai‘i), the sixth edition took place on May 13 in Estoril, Portugal, in conjunction with AAMAS 2008, the main international conference on autonomous agents and MAS. ProMAS 2008 received 27 submissions. These were reviewed by members of the Program Committee, and 12 papers were accepted for presentation.

At the workshop, in addition to the regular papers that were presented, Dana Nau (University of Maryland) gave an invited talk about planning and multi-agent systems. There are many interesting links between planning and agent programming languages for multi-agent systems. We believe that the agent programming community can learn from the progress made in the planning community, and, vice versa, may have potential to contribute to relatively new topics addressed in the planning community such as real-time and multi-agent planning. For this reason, we are also happy that Dana Nau provided an invited paper for this ProMAS proceedings-volume.

In his paper, Nau throws some light on how to cope with the intrinsic complexity that an automated planner would face in the context of multi-agent settings. Now that the field of automated planning has recently experienced tremendous progress and planners are able to deal with complex and reasonably sized
problems, enhancing agent systems with explicit planning capabilities becomes appealing. However, planning in multi-agent settings is much more complex than the classical planning setting: “the actions of the other agents can induce a combinatorial explosion in the number of contingencies that the planner will need to consider, making both the search space and the solution size exponentially larger.” Nau describes three promising approaches to tackle such complexity, namely, state abstraction, explicit use of procedural domain information, and adequate frameworks for interleaving planning and execution. Although interesting work has already been done, both in the agent and planning communities, we believe integrating planning into multi-agent frameworks is an open challenge that will receive increasing research attention in the upcoming years.

As at previous editions, the themes addressed in the accepted papers included in this Volume range from technical topics related to, for example, security issues to conceptual issues related to, for instance, incorporating norms in multi-agent systems. More specifically, new contributions are included related to extensions and innovations of agent programming languages, contributions related to social dimensions of multi-agent systems, and contributions related to tools and environments in which agents operate.

**Agent Programming Languages**

The paper by Hindriks et al. presents an extension of the agent-programming language GOAL with a utility-based lookahead planning capability. The idea is that quantitative heuristics added to a GOAL agent program may be used to prune some of the options for action derived by the qualitative action selection mechanism of such an agent. The paper thus allows for a mechanism to optimize agent behavior based on costs and rewards that may be associated with an agent’s actions.

The paper by Dennis and Fisher introduces an agent infrastructure layer (AIL) that supports multiple, heterogeneous agent frameworks. AIL is a Java toolkit to support the implementation of a variety of agent programming languages including Gwendolen, SAAPL, and GOAL by implementing a set of transition rules that support these languages. AIL is proposed as a step toward formal verification of heterogeneous multi-agent systems that consist of agents written in a variety of agent languages.

The paper by Tinnemeier et al. introduces organizations and norms as an extension of agent programming. The programming language proposed is designed to implement multi-agent organizations. Various normative aspects of organizations including monitoring of behavior, regimenting behavior, and sanctioning are discussed.

The paper by Novak discusses the agent-programming language Jazzyk as a means for programming agents that use heterogeneous knowledge representations in order to achieve their objectives. The basic idea is that different tasks require different knowledge representation techniques and a principled approach is needed to allow for this. The semantics based on behavioral state machines is discussed as well as an implementation of an interpreter for Jazzyk.
Multi-Agent Systems Frameworks

The paper by Neville and Pitt describes a programming and simulation environment for prototyping and testing societies of agents, called PRESAGE. The Java-based environment is designed to allow developers to investigate properties that emerge from long-term, global system behavior. The idea then is to use the PRESAGE platform for prototyping to investigate system-wide performance and emergent behaviors before frameworks such as JADE or AgentBuilder are used to implement the multi-agent system.

The work by Gaud et al. presents JANUS, a platform that allows the development of holonic multi-agent systems. Thus, the idea behind the platform is the modeling of multi-agent systems as recursive entities. JANUS deals with an explicit representation of roles and organizations as first-class entities, and provides a direct implementation of part of the CRIO metamodel. The paper provides a complete description of the platform and describes an example of a market-like community.

The paper by Magarinop et al. proposes a complete computerized process of the Delphi protocol by which expert humans/agents can come to an agreement using iterative question–answer sessions. A model of the Delphi process using the INGENIAS methodology is first developed; the resulting INGENIAS model is a high-level, domain-independent description of the goals and tasks involved in the Delphi method. The paper then goes on to implement and evaluate the approach by providing the details for one domain-specific instance, showing an improvement over the Delphi process without the use of the INGENIAS model.

Agent Environments and Tools

The paper by Acay et al. argues that a suitable modeling of the environment would help agents to learn, understand, and adapt to it at run time. To that end, the paper explores the relation between the agent reasoning and the availability of tools and artifacts populating the agent’s situated environment. The authors coined the term extrospection to refer to the act of an agent reasoning about the tools that become available at run time.

Bade et al. deal with how information about potentially highly dynamic environments can be collected and made available to interested agents in an efficient and effective way across multiple agent platforms. In this respect an abstract model of an infrastructure for resource-aware agents is proposed that allows providing generic as well as application-dependent information channels which agents can use. The authors present an implementation of the infrastructure and argue that exchangeable discovery and distribution protocols as well as exchangeable query and representation languages simplify the development of agent applications based on reusable components.

The work of Serrano et al. focusses on the analysis of an implemented multi-agent system based on message exchanges recorded during actual execution runs. Concretely, the authors use aspect-oriented programming to obtain information about sent and received messages from arbitrary running agent platforms. Moreover an algorithm for achieving a logical ordering of messages sent across agents...
running on distributed hosts is presented. The approach is implemented in a
generic tool for debugging and testing of distributed multi-agent-based software
systems.

The paper of Erdene-Ochir et al. is also about multi-agent tools and presents
Toolipse, an integrated development environment (IDE) for building applications
based on the JIAC agent platform. Interestingly, JIAC and its corresponding
tools have originally been developed as closed, commercial software and have only
recently been released to the public. This means that, although the presented
IDE is a more recent development, it is based on many years of experience in
building multi-agent systems for real industrial applications.

In the paper of Such et al. it is argued that security features are an important
aspect of agent platforms, but that such features also usually tend to degrade
performance. Therefore an evaluation of different security protocols has been
made and a new secure platform design is proposed based on the Kerberos secu-
rity protocol and on Linux access control mechanisms. The design is realized in
the Magentix platform, which the authors evaluate with respect to performance.

Agent Contest

This volume also includes short papers related to the Agent Contest 2008
(http://cig.in.tu-clausthal.de/agentcontest2008/). The Agent Contest has been
organized since 2006 in conjunction with ProMAS. This year’s contest was or-
ganized by Tristan M. Behrens, Jürgen Dix, and Peter Novák from Clausthal
University of Technology, Germany and Mehdi Dastani from Utrecht University,
The Netherlands. The challenge for the participants was driving herds of cows
into a corral by designing and implementing strategies for controlling cowboy
agents. This scenario puts much more emphasis on the coordination between
agents than in previous years. The actual contest took place in May 2008. Like
last year, the winner of this year’s contest was the JIAC team from the Tech-
nische Universität Berlin, Germany. Six of the participant teams of the Agent
Contest 2008 contributed a short paper that briefly describes the design and
implementation of the multi-agent system developed by the team.

As for previous editions, we hope that the work described in these proceedings
will contribute to the overall goal of stimulating the uptake of agent programming
languages and the creation of industrial-strength programming languages and
software tools that facilitate the development of multi-agent systems.
The ProMAS 2008 workshop was held on May 13 2008, in Estoril, Portugal. The workshop was part of the AAMAS 2008 Workshop Program.

Organizing Committee

Koen V. Hindriks  
Delft University of Technology, The Netherlands
Alexander Pokahr  
University of Hamburg, Germany
Sebastian Sardina  
RMIT University, Australia

Steering Committee

Rafael H. Bordini  
University of Durham, UK
Mehdi Dastani  
Utrecht University, The Netherlands
Jürgen Dix  
Clausthal University of Technology, Germany
Amal El Fallah Seghrouchni  
University of Paris VI, France

Program Committee

Matteo Baldoni  
Università degli Studi di Torino, Italy
Juan A. Botia Blaya  
Universidad de Murcia, Spain
Lars Braubach  
University of Hamburg, Germany
Jean-Pierre Briot  
University of Paris 6, France
Keith Clark  
Imperial College, UK
Rem Collier  
University College Dublin, Ireland
Yves Demazeau  
Institut IMAG - Grenoble, France
Frank Dignum  
Utrecht University, The Netherlands
Michael Fisher  
University of Liverpool, UK
Jorge Gómez-Sanz  
Universidad Complutense Madrid, Spain
Vladimir Gorodetsky  
Russian Academy of Sciences, Russia
Dominic Greenwood  
Whitestein Technologies, Switzerland
Benjamin Hirsch  
TU-Berlin, Germany
Shinichi Honiden  
NII, Tokyo, Japan
Jomi Hübner  
Universidade Regional de Blumenau, Brazil
Michael Huhns  
University of South Carolina, USA
Yves Lespérance  
York University, Canada
João Leite  
Universidade Nova de Lisboa, Portugal
John-Jules Meyer  
Utrecht University, The Netherlands
Jörg Müller  
Clausthal University of Technology, Germany
David Morley  
SRI, USA
Oliver Obst  
CSIRO, Australia
Andrea Omicini  
University of Bologna, Italy
Agostino Poggi  
Università degli Studi di Parma, Italy
Alessandro Ricci  DEIS, Università di Bologna, Italy
Birna van Riemsdijk  Ludwig-Maximilians-Universität, Germany
Ralph Rönnquist  Intendico, Australia
Ichiro Satoh  NII, Kyoto, Japan
Kostas Stathis  City University London, UK
Paolo Torroni  University of Bologna, Italy
Tran Cao Son  New Mexico State University, USA
Gerhard Weiß  Software Competence Center Hagenberg, Austria
Michael Winikoff  RMIT University, Melbourne, Australia
Wayne Wobke  University of New South Wales, Australia

Additional Referees

Cristina Baroglio  Jean-Daniel Kant
Joris Deguet  Shakil Khan
Roberto Ghizzioli  Guillaume Piolle
# Table of Contents

Planning for Interactions among Autonomous Agents .................. 1  
*Tsz-Chiu Au, Ugur Kuter, and Dana Nau*

## Agent Programming Languages

Exploring Heuristic Action Selection in Agent Programming .......... 24  
*Koen V. Hindriks, Catholijn M. Jonker, and Wouter Pasman*

Programming Verifiable Heterogeneous Agent Systems ................. 40  
*Louise A. Dennis and Michael Fisher*

Orwell’s Nightmare for Agents? Programming Multi-agent Organisations ................................................................. 56  
*Nick A.M. Tinnemeier, Mehdi Dastani, and John-Jules Ch. Meyer*

Jazzyk: A Programming Language for Hybrid Agents with  
Heterogeneous Knowledge Representations ............................ 72  
*Peter Novák*

## Multi-agent Systems Frameworks

PRESAGE: A Programming Environment for the Simulation of Agent  
Societies ............................................................................. 88  
*Brendan Neville and Jeremy Pitt*

An Organisational Platform for Holonic and Multiagent Systems ...... 104  
*Nicolas Gaud, Stéphane Galland, Vincent Hilaire, and  
Abderraﬁâa Koukam*

A Complete-Computerised Delphi Process with a Multi-Agent  
System .................................................................................. 120  
*Iván García-Magariño, Jorge J. Gómez-Sanz, and  
José R. Pérez-Agüera*

## Agent Environments and Tools

How Situated Is Your Agent? A Cognitive Perspective ................. 136  
*Dağhan L. Acay, Liz Sonenberg, Alessandro Ricci, and  
Philippe Pasquier*

An Awareness Model for Agents in Heterogeneous Environments ...... 152  
*Dirk Bade, Lars Braubach, Alexander Pokahr, and  
Winfried Lamersdorf*
Infrastructure for Forensic Analysis of Multi-Agent Systems .......................... 168
Emilio Serrano and Juan A. Botia

Toolipse: An IDE for Development of JIAC Applications ............................... 184
Erdene-Ochir Tuguldur, Axel Hessler, Benjamin Hirsch, and Sahin Albayrak

Kerberos-Based Secure Multiagent Platform ................................................. 197
Jose M. Such, Juan M. Alberola, Ana Garcia-Fornes, Agustin Espinosa, and Vicent Botti

Agent Contest

Agent Contest Competition: 4th Edition ..................................................... 211
Tristan M. Behrens, Mehdi Dastani, Jürgen Dix, and Peter Novák

AC08 System Description ............................................................................. 223
Jacek Szklarski

Herding Agents - JIAC TNG in Multi-Agent Programming Contest 2008 ........ 228
Axel Hessler, Jan Keiser, Tobias Küster, Marcel Patzlaff, Alexander Thiele, and Erdene-Ochir Tuguldur

On Herding Artificial Cows: Using Jadex to Coordinate Cowboy Agents .............. 233
Gregor Balthasar, Jan Sudeikat, and Wolfgang Renz

Using Jason and Moise + to Develop a Team of Cowboys .............................. 238
Jomi F. Hübner, Rafael H. Bordini, and Gauthier Picard

Dublin Bogtrotters: Agent Herders ............................................................. 243
Mauro Dragone, David Lillis, Conor Muldoon, Richard Tynan, Rem W. Collier, and Gregory M.P. O’Hare

SHABaN Multi-agent Team to Herd Cows ............................................... 248
Adel T. Rahmani, Alireza Saberi, Mehdi Mohammadi, Amin Nikanjam, Ehsan Adeli Mosabbeb, and Monireh Abdoos
